

# Data Analysis v2

Anna P. Archer

2024

```
library(knitr)
knitr::opts_chunk$set(error = TRUE) # Set global option to continue knitting even if errors occur
```

Step 1 – Loading packages and libraries

```
library(tidyverse)
```

```
## -- Attaching core tidyverse packages ----- tidyverse 2.0.0 --
## v dplyr      1.1.4      v readr      2.1.5
## v forcats    1.0.0      v stringr   1.5.1
## v ggplot2    3.5.1      v tibble    3.2.1
## v lubridate  1.9.3      v tidyr     1.3.1
## v purrr      1.0.2
## -- Conflicts ----- tidyverse_conflicts() --
## x dplyr::filter() masks stats::filter()
## x dplyr::lag()     masks stats::lag()
## i Use the conflicted package (<http://conflicted.r-lib.org/>) to force all conflicts to become errors
```

```
library(readr)
library(conflicted) #loads conflicted package to provide conflicted resolution strategy to tidyverse packages
library(dplyr)
library(tibble) #For tibble formatting
library(lubridate) #For date formatting
library(clock)
library(stringr)
library(tidyr)
library(datasets)
library(DT)
library(ggplot2)
```

Step 2 - Importing datasets, assing variables to each dataset and convert them to tibbles for easier read.

```
#Import PRC Dataset and assign to variable
```

```
PRC2024 <- read.csv("PRC2024.csv")
```

Step 3 - Summary of PRC2024 dataset

# summary(PRC2024)

23: Because there too many NAs in the date of breach (24,592) and reported date (2,489) then the following must be applied depending on if the organization is a MED organization or not:

Let's break down the requirements:

If the Organization.Type = MED and If Max.Records.Impacted >= 500 and If Reported.Date.New is NA and Date.of.Breach.New is not NA then Reported.Date.New = Date.of.Breach.New + 60 days

If the Organization.Type = MED and If Max.Records.Impacted >= 500 and If Reported.Date.New is not NA and If Date.of.Breach.New is NA then Date.of.Breach.New = Reported.Date.New - 60 days

If the Organization.Type is not MED and If Reported.Date.New is NA and Date.of.Breach.New is not NA then Reported.Date.New = Date.of.Breach.New + 30 days

If the Organization.Type is not MED and If Reported.Date.New is not NA and If Date.of.Breach.New is NA then Date.of.Breach.New = Reported.Date.New - 30 days

After the above code the number of NA's in the date of breach new and the reported date are 3,736 and 1,891 respectively.

The new NA's for MED organizations still 1319.

```

```
[1] 4603
```

There are 4,603 MED organizations had breaches between 2015 and 2023.

2: INFO for the SAMPLE This code is needed for sample and population With this code I looked at the range of dates between 2015 and 2023 and counted how many records belonged to the healthcare organization that were more than 500 records affected

```
library(dplyr)

# Assuming your data frame is named PRC2024_cleanV2
result <- PRC2024_cleanV2 %>%
  dplyr::filter(Year.of.Breach >= 2015 & Year.of.Breach <= 2023 & Max.Records.Impacted >= 500 & Organization.Type == "MED") %>%
  summarise(count_records = n())

# Print the result
print(result$count_records)
```

```
## [1] 4079
```

```
[1] 4079
```

There are 4,079 MED organizations with 500 or more records affected between 2015 and 2023.

3: This is the code for less than 500 records

```
library(dplyr)

# Assuming your data frame is named PRC2024_cleanV2
result2 <- PRC2024_cleanV2 %>%
  dplyr::filter((Year.of.Breach >= 2015) & (Year.of.Breach <= 2023) & (Max.Records.Impacted < 500) & (Organization.Type == "MED")) %>%
  summarise(count_records = n())

# Print the result
print(result2$count_records)
```

```
## [1] 524
```

```
[1] 524
```

There are 524 MED organizations with less than 500 records affected between 2015 and 2023.

4: How many total data breaches between 2015 and 2023

```
# Using base R to count the number of rows where Year1 is between 2015 and 2023
count_breaches <- nrow(PRC2024_cleanV2[PRC2024_cleanV2$Year.of.Breach >= 2015 & PRC2024_cleanV2$Year.of
# Print the count
print(count_breaches)
```

```
## [1] 22422
```

```
[1] 22422
```

There are 22,422 total data breaches between 2015 and 2023

5: How many total data breaches

```
count_breaches_all <- nrow(PRC2024_cleanV2[PRC2024_cleanV2$Year.of.Breach, ])
# Print the count
print(count_breaches_all)
```

```

## MACHINE LEARNING MODELS AS PART OF EDA

This R code performs an analysis of variance (ANOVA) to assess the relationship between the dependent variable `Records_Affected` and the independent variables `Type_of_Breach` and `State` in the `PRC2024 Clean` dataset.

Effect of type of breach and state to all the records impacted.

Breach.Input: This factor has 6 degrees of freedom (Df). The Sum of Squares (Sum Sq) is very large, meaning there's a lot of variability. The Mean Square (Mean Sq) is also quite large. The F value (4.531) is the ratio of the mean square of this factor to the mean square of the residuals, and its p-value ( $\Pr(>F)$ ) is 0.000134. Since this p-value is much smaller than 0.05, it means that Breach.Input has a significant effect.

State: This factor has 57 degrees of freedom. Its F value (1.074) and p-value (0.327354) show that it does not have a significant effect because the p-value is much larger than 0.05.

Residuals: These are the remaining variations not explained by Breach.Input or State. The Sum Sq is very large, with 25192 degrees of freedom.

The “\*\*\*” next to the p-value for Breach.Input indicates strong significance. In simple terms, Breach.Input significantly impacts the outcome, while State does not.

This R code performs an analysis of variance (ANOVA) to assess the relationship between the dependent variable Max.Records.Impacted and the independent variable Type\_of\_Breach in the PRC2024 clean dataset. Additionally, it includes a Tukey's Honestly Significant Difference (HSD) post-hoc test to compare means between levels of the Type\_of\_Breach variable.

Effect of the type of breach accross all years and all the records.

This output has two parts: an ANOVA table and Tukey multiple comparisons.

## ANOVA Table

- **Breach.Input:** With 6 degrees of freedom, it has a significant effect on the dependent variable (Max.Records.Impacted), as indicated by a large F value (4.53) and a very small p-value (0.000135, \*\*\*).
- **Residuals:** Represent unexplained variation, with 25249 degrees of freedom.

## Tukey's Multiple Comparisons

Tukey's test compares means of different groups within Breach.Input:

- **INSD-HACK:** The difference between these breach types is significant ( $p \text{ adj} = 0.0000229$ ), with confidence intervals not including zero.
- Most other comparisons have high p-values (close to 1), indicating no significant differences between those breach types.

In summary, Breach.Input significantly affects the outcome, particularly the difference between INSD and HACK is significant. Other comparisons show no significant differences.

ANOVA Model to assess whether there are statistically significant differences in the Max.Records.Impacted due to the different factors. Max.Records.Impacted is the dependent variable Breach.Type + Reported.Date.New + Year.of.Breach = Independent variables Year.of.Breach:Reported.Date.New = represents the interaction between the terms

Year.of.Breach and Reported.Date.New. An interaction term is included when the effect of one independent variable on the dependent variable may depend on the level of another independent variable. In other words, it tests whether the relationship between Year.of.Breach and Max.Records.Impacted changes at different dates of Reported.Date.New.

Results from the model:

The output includes ANOVA results for Breach.Input, Reported.Date.New, and Year.of.Breach:

- **Breach.Input:** Significant effect (p-value = 0.000134, \*\*\*).
- **Reported.Date.New:** No significant effect (p-value = 0.661381).
- **Year.of.Breach:** Significant effect (p-value = 0.005575, \*\*).
- **Interaction (Reported.Date.New:Year.of.Breach):** No significant effect (p-value = 0.111588).
- **Residuals:** Represent unexplained variation.

In summary, both Breach.Input and Year.of.Breach significantly impact the outcome, while Reported.Date.New and their interaction do not.

THE FOLLOWING MODELS ANSWER RESEARCH QUESTION 1-

RQ1: What are the characteristics of data breaches that predict the nature and severity of the attacks most effectively?

H1o There is no difference in the predictive ability of different characteristics of data breaches to identify the type of data breach attack and the attack level. H1a There is a difference in the predictive ability of different characteristics of data breaches to identify the type of data breach attack and the attack level

(This question focuses on the characteristics of databreaches that predict medical databreaches, so for this model the train\_data\_sev saved and then filter only MED orgs.)

THE FOLLOWING MODELS ANSWER RESEARCH QUESTION 2-

RQ2: Does the number of records affected is correlated to the severity of the cyber-attack?

H20 The characteristics of data breaches cannot effectively predict the size of affected records. H2A The characteristics of data breaches are able to effectively predict the size of affected records

These question explores all of the data breaches not only the medical ones.

First, we are going to create the severity variable from the PRC Clean V2 dataset.

```
# Load necessary libraries
library(dplyr)
library(scales)

# Load existing dataset
# Assuming your dataset is in a CSV file named 'PRC2024_CleanV2.csv'
data <- read.csv('PRC2024_CleanV2.csv')

# Normalize 'Max.Records.Impacted'
data <- data %>%
  mutate(normalized_records = rescale(Max.Records.Impacted))

# Identify unique values in 'Breach.Input' and 'Organization.Type'
unique_attacks <- unique(data$Breach.Input)
unique_industries <- unique(data$Organization.Type)
```

```

# Generate mappings for the unique values
attack_mapping <- setNames(seq(0.1, 1, length.out = length(unique_attacks)), unique_attacks)
industry_mapping <- setNames(seq(0.1, 1, length.out = length(unique_industries)), unique_industries)

# Map 'Breach.Input' and 'Organization.Type' to numerical values
data <- data %>%
  mutate(attack_score = attack_mapping[Breach.Input],
         industry_score = industry_mapping[Organization.Type])

# Calculate severity score
data <- data %>%
  mutate(severity_score = 0.5 * normalized_records +
         0.3 * attack_score +
         0.2 * industry_score)

# Function to create severity category based on given conditions
create_severity <- function(data) {
  data$severity_category <- with(data, ifelse(
    Max.Records.Impacted >= 1 & Max.Records.Impacted <= 499, "Below500",
    ifelse(Max.Records.Impacted >= 500 & Max.Records.Impacted <= 2000, "Low",
    ifelse(Max.Records.Impacted >= 2001 & Max.Records.Impacted <= 4000, "Med", "High"))
  )))
  return(data)
}

# Apply the function to the dataset
data <- create_severity(data)

# View the dataset with the new columns
view(data)

```

Save the new dataset as 'prc\_with\_severity.csv'

```

# Save the new dataset as 'prc_with_severity.csv'
write.csv(data, 'prc_with_severity.csv', row.names = FALSE)

view(prc_with_severity)

```

## Error in eval(expr, envir, enclos): object 'prc\_with\_severity' not found

Now lets split the new dataset to be used in the below models

```

# Set seed for reproducibility
set.seed(123)

# Calculate number of data points in the dataset
n <- nrow(data)
n_train <- floor(0.70 * n)
n_val <- floor(0.10 * n)
n_test <- n - n_train - n_val # This ensures all data is used

# Create a random permutation of indices

```

```

indices <- sample(seq_len(n))

# Assign indices to each dataset
train_indices <- indices[seq_len(n_train)]
val_indices <- indices[(n_train + 1):(n_train + n_val)]
test_indices <- indices[(n_train + n_val + 1):n]

# Split the data
train_data_sev <- data[train_indices, ]
val_data_sev <- data[val_indices, ]
test_data_sev <- data[test_indices, ]

# Save the split datasets
write.csv(train_data_sev, 'train_data_sev.csv', row.names = FALSE)
write.csv(val_data_sev, 'val_data_sev.csv', row.names = FALSE)
write.csv(test_data_sev, 'test_data_sev.csv', row.names = FALSE)

# Print the first few rows of each dataset to verify
view(train_data_sev)
view(val_data_sev)
view(test_data_sev)

```

Now lets convert the new train, val and test datasets to factor

```

# Load necessary libraries
library(tidyverse)

# Function to convert all columns to factors
convert_to_factors <- function(data) {
  data %>%
    mutate(across(everything(), as.factor))
}

# Apply the function to all datasets
train_data_sev <- convert_to_factors(train_data_sev)
val_data_sev <- convert_to_factors(val_data_sev)
test_data_sev <- convert_to_factors(test_data_sev)

```

Model 1 - Multinational Regression, Multinational Naïve Bayes, Multiclass SVM, Random Forest and then create an ensemble of the best three models based on validation performance.

(these models study all of the records not only medical records, therefore it should use the train\_data\_sev, test\_data\_sev and val\_data\_sev datasets)

THIS CODE STOPPED WORKING

```

THE FOLLOWING MODELS ANSWER RESEARCH QUESTION 3-

RQ3: Does the demographics of a company influence the kind of cyber-attacks they experience?

H30 There is no effect to the different types of cyber attacks from the characteristics of data breaches. H3A There is an effect to the different types of cyber attacks from the characteristics of data breaches.

(these models study all of the records not only medical records, therefore it should use the train\_data, test\_data and val\_data datasets)

THE FOLLOWING MODELS ANSWER RESEARCH QUESTION 4-

RQ4: To what extent and direction the various types of cyber attacks evolved since 2015?

H40 There is no significant relationship between the different types of attacks and the size of the types of attacks and how it increases it has increased since 2015. H4A There is a significant relationship between the different types of attacks and the size of the types of attacks and how it increases it has increased since 2015.

ANOVA

1- The following code creates an ANOVA model exploring the relationship between the types of cyber attacks since 2015 for MED organizations and Records affected.

(This question focuses on the characteristics of databreaches that predict medical databreaches, so for this model the train\_data2 split has to be used.)

LSTM TIME SERIES MODELS –

1- The following code creates a time series using the date of breach year from 2015 forward

this model should only be looking at the attack size and year of breach variables to know and understand if the number of breaches per year since 2015 have increased or decrease.

THE FOLLOWING MODELS ANSWER RESEARCH QUESTION 5-

RQ5: How does the application of multinomial regression help in identifying distinct groups within a dataset based on their characteristics, and what insights can be derived from these groupings?

H50 The application of multinomial regression does not help in identifying distinct groups within a dataset based on their characteristics. H5A The application of multinomial regression help in identifying distinct groups within a dataset based on their characteristics.

(This question focuses on the distinct groups in the dataset not just medical, so for this model the train\_data split has to be used.)
